

The Mission Control Manifesto

For Hybrid Human-AI Product Development

March 2026

*We are uncovering better ways of building software
by doing it with human-AI teams and helping others do the same.*

Through this work, we have come to value:

Governed AI participation over uncontrolled AI usage

Organizational knowledge over individual prompting

Verified deliverables over generated artifacts

Hybrid team orchestration over individual productivity

*That is, while there is value in the items on the right,
we value the items on the left more.*

Principles

1. Every AI output has a human checkpoint proportional to its risk.
2. Authority flows from humans to AI, never the reverse.
3. Accountability requires traceability. Every production artifact must trace back to its approval, plan, and requirement.
4. Solve every problem once. Make it available to every future project.
5. Knowledge must include the *why*, not only the *what*.

6. Connect all sources, fragment none. One knowledge graph, not seven silos.
 7. Define clear roles for humans and AI, and the handoff points between them.
 8. AI is a team member with a job description, not a magic oracle.
 9. Plan before you generate. Review before you execute. Verify before you ship.
 10. Measure verified output, not generated volume.
 11. Replace ceremonies with continuous governance.
 12. The platform is the methodology. A methodology that exists only in a wiki is a suggestion. A methodology embedded in the toolchain is a practice.

Signatories

Marek Zuchowski, CEO, Macrix Technology Group

*"SCRUM asked: how do we coordinate humans building software?
Mission Control asks: how do we orchestrate humans and AI building
software together?
The answer is not a better standup. It is a new operating system for
product development."*

*This manifesto is a living document. What will not change is the conviction that
human judgment, organizational knowledge, and structured governance
are what turn AI from a risk into a superpower.*
